

## JUNIOR POSTDOCTORAL POSITION

We are looking for enthusiastic and highly motivated candidates to lead a project that involves mouse models of melanoma brain metastases, omic approaches and organotypic cultures among others. This is a Junior postdoc position funded by the Harry J. Lloyd Trust available from October 2017.

### **Research Focus**

Melanoma is the most deadly form of skin cancer. Unfortunately despite the existing public campaigns to prevent melanoma, its incidence continues to increase worldwide. Brain metastases are associated with very poor prognosis in melanoma patients and constitute a leading cause of death from this cancer type. Our aim is to gain insight into the molecular determinants of melanoma brain metastases and particularly the contribution of the brain microenvironment to melanoma metastatic colonization and response to therapies.

The group is located at the Instituto de Neurociencias (San Juan de Alicante, Spain), a Severo Ochoa Center of Excellence that offers a unique multidisciplinary environment, both in the neurosciences and in the cancer fields, to develop a successful scientific career.

### **Eligibility:**

- Previous experience working with mouse models will be a major advantage for the position.
- Experience in Neurobiology will be highly valued.
- Additional experience in cell biology, genomics and/or bioinformatics will be considered.
